

## ABSTRACT

A method for recording data in a communications system and a communications system comprising at least one wireless terminal (UE), a video camera (CAM) coupled to the wireless terminal for providing the wireless terminal with a continuous data stream comprising at least video data, a communications network (1) with a wireless access network (RAN) and data storage means (MEM1, MEM2) connected to the communications network (1), whereby the wireless terminal (UE) is arranged to forward the data stream substantially instantly to the communications network (1) wirelessly via said wireless access network (RAN), and the communications system is arranged to store the data stream forwarded to the communications network in the data storage means connected to the communications network.
